

The Benefits of Collaborative Care for Your Patients and Your Practice

There is a trend to render dentistry to a commodity by some corporate centers and insurance companies. These trends not only reduce the focus on patients as people, but also reduce profitability. Quality collaborative care returns the focus of care back to the patient as a person and increases profitability in the process. This seminar will demonstrate the value of collaborative care both for your patient and for your practice.

Why you should not miss this seminar!

Topics to be discussed:

- Current trends in the treatment of periodontitis and peri-implant disease
- The implant maintenance appointment - ***What you need to know?***
- Treatment of Periodontal Disease using Dental Lasers: Diode vs NdYAG ***When to treat, when to refer?***
- The use of locally delivered chemotherapeutics and antimicrobials in the treatment of periodontal and peri-implant diseases.

What does the evidence show us?
